DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-4 and 6 are rejected under 35 U.S.C. 102(b) as being anticipated by Muller et al. (US 4,597,752).

Muller et al. disclose a continuous folding device comprising pivotable swing arm 102 which guides paper 4 in an accordion fashion upon a platform; see figure 1. Swing arm 102 further comprises telescopic members 26 (main arm body) and 27 (sub arm body) for varying the length of the guiding member.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Muller et al. (US 4,597,752) in view of Inouye et al. (US 4,723,488).

Muller et al. disclose stopping the swinging arm by controlling motor 18 however the table of Muller et al. does not move vertically nor has a detection mechanism for controlling vertical movement. However Inouye et al. describe a similar swinging folder device comprising vertically controlled table 16; see figure 1. Sensors 1717 and 1718 detect proper positioning of the stacked paper and control raising and lowering of the table 16 according to preset values; see figures 14a and 14b. Thus if an error is detected which does not correspond to the number of fold counts the table is lowered until the height is detected by sensor 1717. When the table is stopped at step S122, the next step is S123, which raises the table level and resetting the counter; see column 19, lines 29-35.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the teachings of Inouye et al. in the invention of Muller et al. in order to provide disruption-free stacking in the proximity of the deposit means.
